The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding anglogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma rhematoid arthritis, multiple sclerosis), infertility, AIDS and diabetes and ratinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and gene mapping.

The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in

The invention relates to novel human anglogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells . . . comprising a PRO nucleic acid, the recombinant production of a PRO protein, agonists of a RRO protein, agonists of a RRO protein, adonists of a PRO protein, and comprising a PRO protein, agonists or antagonists of a PRO protein, and comprising a PRO protein, adonists or a carlotvality; diagnosing of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO or activity; diagnosing of additionally encompasses methods of identifying modulators of PRO antagonist; a retroviral gene therapy vector comprising a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, or stimulating endothelial or PRO nucleic acid; on moduced acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenist thereof. PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenist thereof. PRO nucleic acids, PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, proporteins, antibodies against PRO proteins, adherencelease, or stroke acids, myocadelal infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, and appeades encoding PRO proteins, a phybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to map genes encoding PRO proteins, to map genes encoding PRO proteins, and processes encoding PRO proteins, to map genese encoding pro proteins and processes encoding properties, as hybridisa
                                                                                                                                                                                                                                                                                                                                                             Goddard A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a human leucine-rich repeat (LRR) family member (referred as 1919) protein. The 1919 protein is useful for treating cell proliferative or differentiative disorder, e.g., cancer disorders or neuronal disorders, neurological disorders, demyelinating diseases such as multiple sclerosis, degenerative diseases such as Alzheimer's disease and Huntington's disease, spinocerebellar degenerations, disorders of the central or peripheral nervous system, bone disorders such as osteoporosis, immune disorders such as rheumatoid arthritis, diabetes mellitus, cardiovascular disorders, riral diseases, pain or metabolic disorders. They are also useful as markers for the predisposition of disease states, or for precursors or markers for the predisposition of disease states. They are useful in screening and detection assays such as chromosomal mapping, tissue typing, and forensic biology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             . 6

The present sequence is the cc359_4 secreted protein encoded by the cDNA clone cc359_4. cc359_4 was isolated from a human adult brain cDNA library using methods specific for secreted protein cDNAs. The leader sequence or signal peptide acts as a transmembrane domain due to its hydrophobic nature. The TopPredII computer program predicts five potential transmembrane domains centered around amino acids 20, 410, 490, 530 and 590. This protein has a leucine zipper motif. The polynucieotide and protein may effect nutrilional activity, cytokine and cell proliferation, immune stimulation or suppression, hematopoiesis regulation, tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; tumour; diagnosis; neoplastic disease; neoplastic cell growth;

are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides membrane-bound PRO polypeptides and polyucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various anizymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences

The present sequence is a numbrane associated polypeptides.

The invention relates to secreted and membrane associated polypeptides.

The invention relates to secreted and membrane associated polypeptides.

The invention are useful for treating diseases such as Alzheimer's disease, invention are useful for treating diseases such as Alzheimer's disease, amyotrophic lateral sclerosis (ALS), Zollinger-Ellison syndrome, diseases of the immune system, haematopoletic disease, inflammation, anxiety.

Cof the inmune system, neoropathy, aging, sexual disorder, learning and memory alteration and altered immune response, selzure, migraine, cancer, stroke, asthma, neuropathy, aging, sexual disorders, treatment of transsexuals, growth abnormalities, obesity, infections, autoimmune of transsexuals, growth abnormalities, obesity, infections, autoimmune cancer, stroke, asthma, neuropathy, aging, sexual disorders, treatment of transsexuals, growth abnormalities, obesity, infections, autoimmune cof diseases (e.g. rheumatoid arthritis), cataractogenesis, angiogenesis, disorders associated with healthy maintenance of gastric mucosa and crepair of acute and chronic mucosal lesion, lung carcinoma, cerebral cischeamia, atherosclerosis, Girhosis, Huntington's disease, headache, ammesia, multiple sclerosis, Girhosis, Huntington's disease, headache, congestive heart failure, cardiac arrhythmias, hypercholesterolaemia, viral and non viral hepatitis, type I and type II diabetes mellitus, congestive heart failure, cardiac arrhythmias, hypercholesterolaemia, plommerulonephritis and malignant hyperthemia. Polypeptides of the invention are used to identify membrane bound and soluble receptors. They are also useful as vaccines for inducing an immunological response.

They are also useful as vaccines for inducing an immunological response.
                                                                                                                                                                                                                                                                                          New secreted and membrane associated polypeptides for treating Alzheimer's disease, psoriasis, cancer, enterocolitis, sleep and sexual disorders, stroke, and asthma
                                                                                                                                                               Xiang Z;

```
Allernate names: slit protein homolog
C; Species: Rattus norvegicus (Norway rat)
C; Accession: T13959
R; Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O.
Genomics 51, 27-34, 1998
A; Title: Identification of high-molecular-weight proteins with multiple EGF-like moti
A; Reference number: Z14126; MUID:98360089
A; Reference number: Z14126; MUID:98360089
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-1523 < NAK>
A; Residues: 1-1533 < NAK>
A; C; Genetics:
A; Ge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                270 WWIKDMAPSNTACCARCNTPPNLKGRYIGELDQNYFTC----YAPVIVEPPADLNVTE 323

Oncogene 16:2997-3002(1998).

--- SUBCELLUIGAR LOCATION: Type I membrane protein (Potential).

--- SINGLARITY: OVERAMPLIFIED IN MALIGNANT GLIOMAS.

--- SIMILARITY: DELONGS TO THE INMUNOGLOBULIN SUPERRAMILY.

--- SIMILARITY: CONTAINS 1 ILMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

--- SIMILARITY: CONTAINS 1 ILMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

--- SIMILARITY: CONTAINS 1 LEUCINE-RICH REPEATS (LRR).

--- SIMILARITY: CONTAINS 1 LEUCINE-RICH REPEATS (LRR).

Biochem. Biophys. Res. Commun. 227:897-902(1996).
-!- FUNCTION: INVOLVED IN PROPEIN PROTEIN INTERACTIONS THAT RESULT IN PROTEIN COMPLEXES, RECRETOR-LIGAND BINDING OR CELL ADHESION.
-!- SUBUNIT: FORMS A TERNARY COMPLEX OF ABOUT 140 TO 150 kDa WITH IGF-I AND IGFEP3 (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: EXCRACellular.
-!- SIMILARITY: CONTAINS 20 LEUCINE-RICH REPEATS (LRR).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proc. Natl. Acad. Sci. U.S.A. 93:10028-10033(1996).
-!- FUNCTION: MAY HAVE AN IMPORTANT ROLE IN REGULATING THE ACCESS CIRCULATING IGFS TO THE TISSUES.
-!- SUBULT: FORMS A TERNARY COMPLEX OF ABOUT 140 TO 150 kDa WITH IGF-I OR IGF-II AND IGFBP-3 (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: Extracellular.
-!- SIMILARITY: CONTAINS 21 LEUCINE-RICH REPEATS (LRR).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2, Ap
